## Interregional Transfer Capability Study 2024 Q4 Update Posted

Click here for: [2024 Q4 Quarterly Update](#)

A strong, flexible transmission system capable of coping with a wide variety of conditions is key for the reliable supply and delivery of electricity. Mandated by Congress, the Interregional Transfer Capability Study (ITCS) examined the extent of total transfer capability between neighboring transmission planning regions and made recommendations for additional transfer capability to strengthen reliability.

The Q4 update is part of NERC's extensive and ongoing effort to inform industry; stakeholders; and federal, state, and provincial partners about ITCS activities and progress. Activities completed in the fourth quarter include:

- Filing the final [Interregional Transfer Capability Study](#) with FERC, providing current total transfer capability analysis between pairs of neighboring transmission planning regions, recommended additions, and how to meet and maintain transfer capability.
- Publishing an [interactive visual aid](#) to accompany the findings.
- Beginning a Canadian analysis to study transfer capabilities from the United States to Canada and between Canadian provinces, due to the interconnected nature of the grid.
- Conducting the first two meetings of the Canadian Analysis Advisory Group, which will oversee the Canadian analysis progression.

The ITCS is crucial to the future of grid reliability, and NERC was uniquely positioned to conduct this complex, one-of-a-kind study. More information can be found on the [ITCS project page](#).
